

Temporal homogeneous-state screen — V7 existence is not a Turing-selection theorem

(a) exact two-by-two symbol obstruction

EXACT/DERIVED

homogeneous stability: $\alpha = f'(a) > 0$

finite- k stationary zero: $\alpha \leq -2r^2\sqrt{\varepsilon} < 0$

incompatible signs
classical stationary Turing onset is excluded

(c) finite- k band after long-wave destabilization

(b) frozen V7 point: no finite- k stationary band

(d) threshold is far outside the frozen slice
